

Future Roadmap

CRM/ERP Platform Documentation

Future Roadmap

Planned features and improvements, roughly prioritized.

Near-term

S3/Cloud File Storage

Replace local disk storage (`backend/uploads/`) with S3-compatible object storage (AWS S3, Cloudflare R2, MinIO). This enables:

- Horizontal scaling (multiple backend instances sharing storage)
- CDN delivery for images
- Signed URLs with expiry for secure file access

Brute-force Protection

Automatic account lockout after N failed login attempts. Currently only manual locking is supported.

Signed File URLs

Replace security-by-obscurity file URLs with time-limited signed URLs that expire after access.

Email Queue via BullMQ

Move email sending from synchronous SMTP calls to the BullMQ queue. Adds retry logic, delivery tracking, and rate limiting.

Medium-term

Mobile App

React Native app using the existing REST API. Focus on record creation, task management, and notifications.

Advanced Formula Engine

Expand `FORMULA` field capabilities:

- Cross-record aggregations (e.g., SUM of related invoice amounts)
- IF/ELSE logic
- Date math (days since, due in X days)

Bulk Import from Excel (.xlsx)

Currently only CSV is supported. Add `.xlsx` parsing via the `xlsx` npm package (already in frontend dependencies).

AI Assistant

Natural language query interface:

- "Show me all contacts created this month with status Active"
- "Create a new lead for Acme Corp with priority High"
- Uses Claude function calling against the existing record API

Two-factor Authentication (2FA)

TOTP (Google Authenticator / Authy) for CRM user accounts.

Custom Domain for Portal

Allow organizations to serve their customer portal from a custom subdomain (e.g., `portal.client.com`).

Long-term

Offline Support (PWA)

Service worker + IndexedDB cache for basic record viewing/editing when offline. Sync on reconnect.

Advanced Reporting

- Scheduled reports delivered by email
- PDF export of dashboards
- Report builder with drag-and-drop

Multi-language (i18n)

UI localization for Arabic, French, Spanish. The backend already returns field labels from the database (not hardcoded), so database content is already configurable per org.

Plugin / Extension System

Allow organizations to install custom modules from a marketplace without forking the codebase.

Webhooks (Inbound)

Full bidirectional webhook support — receive webhooks from external services and trigger workflows.

Calendar View Enhancements

- Drag-to-reschedule records on the calendar view
- Week and day views in addition to month view
- Sync to iCal format

Completed ✓

- Multi-tenant JWT authentication
- Dynamic modules and fields
- Form builder with public submissions
- OCR document extraction (Anthropic Claude)
- Workflow automation engine
- Blueprint stage approval workflow

- Real-time WebSocket notifications
- Customer portal (PortalUser auth, pages, documents)
- Email templates + send from records
- Record routing queues
- Performance tracker
- Google Calendar sync
- Publications & gallery
