

Pivot Table

CRM/ERP Platform Documentation

Pivot Tables

The pivot table feature provides cross-tabular analysis of module records.

Overview

A pivot table aggregates record data across two dimensions:

- **Rows:** Grouped by one field (e.g., Region)
- **Columns:** Grouped by another field (e.g., Product Category)
- **Values:** Aggregated metric (e.g., SUM of Revenue)

API

```
GET /api/v1/pivot/:moduleId/data?rowField=region&colField=category&valueField=revenue&agg
```

Parameters

Param	Required	Description
rowField	Yes	Field name for row grouping
colField	Yes	Field name for column grouping
valueField	No	Field to aggregate (required for SUM/AVG/MIN/MAX)
aggregation	Yes	COUNT , SUM , AVG , MIN , MAX

Param	Required	Description
<code>filters</code>	No	JSON filter array

Response

```
{
  "rows": ["North", "South", "East"],
  "columns": ["Electronics", "Clothing", "Food"],
  "data": {
    "North": {
      "Electronics": 125000,
      "Clothing": 45000,
      "Food": 32000
    },
    "South": {
      "Electronics": 98000,
      "Clothing": 67000,
      "Food": 28000
    }
  },
  "totals": {
    "rowTotals": { "North": 202000, "South": 193000 },
    "colTotals": { "Electronics": 223000, "Clothing": 112000 }
  }
}
```

UI

The pivot table UI is at `/analytics/pivot` in the dashboard. Features:

- Field selector dropdowns for rows, columns, values
- Aggregation type selector
- Filter panel (reuses the standard filter builder)
- Export to CSV
- Transpose (swap rows/columns)

Limitations

- Pivot data is computed on-the-fly from `records.data` JSON — large datasets (>10k records) may be slow. Consider adding database indexes on frequently pivoted fields.
 - Only works with fields that have discrete values (SELECT, STATUS, RADIO) as row/column dimensions. Number fields work as value fields only.
 - Date fields can be used as dimensions if grouped by month/quarter — this is configured in the pivot UI.
-

Example Use Cases

Row	Column	Value	Aggregation
Sales Rep	Month	Revenue	SUM
Product	Region	Units Sold	SUM
Department	Status	Count	COUNT
Lead Source	Stage	Conversion	COUNT
